

Build Bookstore App backend, this should be an admin panel kind.

First no one can enter the website until the admin puts the right authentication (use the rails basic auth for simplicity)

When the admin authenticates to the website, the admin can:

1. List all the products with all its information, the product should have name, image, price, description, created at and updated at.
2. In the last column of the list would be the admin who created this, and you can click on this admin and direct it to the show page of the admin with all his information (name, email, created_at, updated at)
3. At the end of this table the admin can show 3 buttons:
First one is to delete this product that when you press it, it should show a modal (pop up of are you sure you want to delete this product) with two buttons Yes or No, if he press yes the product should be deleted if he presses no nothing happen.

Second is to update this product, and that would redirect the admin to the edit page where he can edit(name/image/description/price) with two buttons of Save and Back. If he pressed save the updated data should be saved and redirect it to the show page, if he presses back, he should be redirected to the list page.

The last button will be show, that will redirect you to the show page of the product, with the back button in this page the redirect to the list page.

At the top of the page, it should be a create button, when the admin press it it'll redirect him to the create product form, the form should include Name/Image/price/description, the admin can't create the product until he fills all of these information, the page should have Save/back buttons, the buttons will redirect him to the list page.
